

Overall structure: one public learning ground

One continuous public learning ground links the three key areas: open training at Zhongzhiyuan, everyday learning at AI Origin Community, and explainable service at Dazhongsi. Two violet transition nodes make knowledge, life and service a reversible spatial process.

A mixed conceptual land-use fabric

Land use is mixed, interwoven and adaptable. All ratios are internal calculations from the provisional constraint and do not state statutory land-use controls, intensity or approval outcomes.

Three key areas, three urban protocols

The three key areas are not generic AI hubs. They work as three different urban protocols: an open training court, an everyday learning street and an explainable service threshold.

Public ground and service corridor

Railway memory, walking, rainwater, shade and the service edge form one public ground. Technical service cannot displace walking, staying or human takeover.

Scenarios, identity and long-term operation

Unfinishedness is made operational through ten scenario cards, visible pause-and-appeal interfaces, annual open days and cross-city retrospectives. The identity system — The Unfinished City — combines a revisable rose public axis, three coloured fields and violet transition nodes.

Metrics, recalculation and risk boundaries

CENTENNIAL JING-ZHANG / CONCEPTUAL

A PROPOSAL THAT CAN BE CHECKED, QUESTIONED AND REVISED

The current ratios are internal concept checks derived from provisional geometry — useful for design consistency, never a substitute for verified planning controls.

REVISION TRIGGER

When verified official geometry or controls arrive, replace provisional constraints, recompute areas and ratios, regenerate drawings and re-open public review.

The 12.0714% green-space and 14.2495% public-space ratios are recalculated from the submitted provisional geometry. When verified geometry or controls are released, layers, metrics, drawings and the visual page must be regenerated.
