

Method before sites | How AI Agents enter urban planning

CORE METHOD

AI does not merely add images to conventional planning. It creates a traceable and correctable judgement chain across evidence, value, space and operations.

This board records planning reasoning and human correction; concept images, provisional boundaries and candidate Agents are never presented as deployed facts.

Evidence-led planning: one belt, three areas, two wings

FIG. 01

A relationship diagram—not a statutory map. Shared IDs connect the report, data, visuals and review gates.

Stable public base + reversible scenarios + human takeover

FIG. 02

AI-native planning changes the unit of design from a fixed facility to a versioned, stoppable service bundle.

Three focus areas × six first moves

FIG. 03

Each point is a service/spatial prototype with a clear status, not an unverified site placement.

SIX TASKS / 六类任务

- Concept
- Ecosystem
- Scenarios
- Landmarks
- Culture
- Operations

Research evidence boards | NTS | provisional | not deployed

One identity, six levels, three reversible logo directions

FIG. 12

Naming separates project title, spatial strategy, public narrative, areas, scenes and points; all identity directions remain candidates pending rights review.

Release rule: name levels cannot be swapped; logo is not registered, approved or final. Rights, bilingual readability, accessibility and withdrawal remain required.

NTS / research diagram / provisional / not deployed

Three cultures, five routes, one correction loop

FIG. 14

History, contemporary interpretation and disputed material remain separate; routes are text/paper first until official anchors and rights are cleared.

EVERY STORY UNIT

- source · date · scale · rights
- bilingual text · version · correction channel
- no unverified international endorsement or causal leap

NTS / research diagram / provisional / not deployed

Four complete scenario cards show the AI–human–fallback contract

FIG. 13

Thirteen cards share the same fields; four are expanded here to make entry, measurement and stop rules immediately legible.

0—4 RELEASE LADDER

A card can move right only after evidence, rights, space, operator and human-gate checks; unknown is a stop signal, not a zero.

NTS / research diagram / provisional / not deployed

Fifteen professional contracts: complete research interface, not sign-off

FIG. 15

Each depth item points to a distinct paragraph, layer, metric, gap and recomputation trigger; unknown controls remain visible.

Unknown fields: FAR, height, ownership, capacity, investment, runtime and professional signatures remain null/unknown until formal evidence arrives. The matrix is a handoff contract, not an approval.
